Lacustrine Facies Analysis (Special Publication 13 of the IAS) (International Association Of Sedimentologists Series) From Wiley-Blackwell

This book considers the deposition of sediments in different types of lakes and shows how changes in the lake environment can be interpreted from the sediment facies at the lake floor. Lakes are particularly sensitive to climate change and thus their sediments are accurate indicators of environmental change and palaeoclimate. This volume examines both ancient and modern lake deposits which is particularly appropriate considering the current widespread interest in global climate change, with particular emphasis on global warming. The book is global in approach and contains fifteen papers from an internationally acclaimed authorship. The volume will be of particular interest to sedimentologists, petroleum geologists, economic geologists and geographers with a particular interest in global climate change
